

INTRODUCTION

This manual has been developed as a study guide for the Florida State Fair Skillathon which is part of the Champion Youth Program. The topic for this year's Skillathon is **nutrition and feeding management**.

The Florida State Fair recognizes that agricultural education instructors, 4H agents, parents, and leaders provide the traditional and logical instructional link between youth, their livestock projects and current trends in the animal agriculture industry. **PLEASE NOTE:** This manual is provided as a **study guide** for the skillathon competition and should be used as an additional aid to ongoing educational programs.

Sections are labeled **Junior, Intermediate & Senior, Intermediate & Senior, or Senior** to help exhibitors and educators identify which materials are required for each age level.

** Additional information is noted in the study manual for preparing for the Champion of Champions competition.

Juniors (age 8-10 as of September 1, 2010)

Digestive tract parts identification
Feed classification & identification

Intermediates (age 11-13 as of September 1, 2010)

Digestive tract functions
Feed tag analysis
Aging by Teeth

Seniors (age 14 and over as of September 1, 2010)

all of the above plus...
Evaluating Feed Efficiency
Evaluating and selecting feedstuffs

GOOD LUCK

Goat Nutrition

What an animal eats, how it is digested, absorbed, utilized and what is excreted are the essence of *nutrition*. Good nutrition is basic to good health and production. Proper feeding requires knowledge of nutrients in feedstuffs available to the producer and the nutrient needs of their animals. It also includes an understanding of animal behavior and a management strategy that allows the animals to consume all that is required without causing digestive upset. Though general rules of thumb are helpful, each situation may require adjustments in order to optimize growth and production.

Nutrients are substances in the diet that support normal body functions. Some nutrients can be manufactured in the animal's body and are classified as *dietary non-essential*. *Dietary essential* nutrients must be provided in the ration. Nutrients can be classified into six groups: *water, carbohydrates, fats (lipids), proteins, vitamins and minerals*.

Water is the most essential nutrient and is involved in all body functions. It is the most abundant and therefore the cheapest nutrient. Animals receive water from drinking as well as from feeds that contain water. An animal that is not receiving enough water will not eat well. Factors that affect an animal's water consumption are the animal's size, feed intake, environmental temperature, humidity, and water quality.

Proteins function as the basic structural unit of the animal body and in metabolism. Protein is the main component of the organs and soft structures of the animal body with the exception of water. The dietary requirement for protein is highest in young, growing animals. All proteins are composed of simple units called amino acids. The particular amino acids in a protein determine the quality of that protein. Protein is one of the most expensive portions of the diet.

Carbohydrates are organic compounds formed in plants by the process of photosynthesis. They constitute about 75% of the dry weight of plants and grain. Carbohydrates serve as a source of energy in the body. A surplus of carbohydrates is transformed into fat and stored.

Fats function much like carbohydrates in that they serve as a source of energy. Fats produce 2 ¼ more energy than carbohydrates when digested; therefore a smaller amount is required to serve the same function.

Vitamins are essential for the development of normal tissue and necessary for metabolic activity. They are effective in the animal body in small amounts. When not eaten correctly and in the right amounts, a specific deficiency disease can result or toxicity may result if eaten in extremely high amounts. Vitamins are classified as being either fat soluble (A, D, E, K) or water soluble (B complex & C).

Minerals are inorganic, solid, crystalline chemical elements. They are classified as being either macro (Ca, P, Na, Cl, K, Mg & S) meaning found in high concentrations or micro minerals (Cr, Co, Cu, F, Fe, I, Mn, Mo, Ni, Se, Si, & Zn) meaning found in trace amounts. Calcium makes up nearly 50% of the total body mineral, phosphorus composes 25%, and other minerals make up the remaining 25%. Minerals function in protein synthesis, oxygen transport, and in skeletal formation and maintenance.

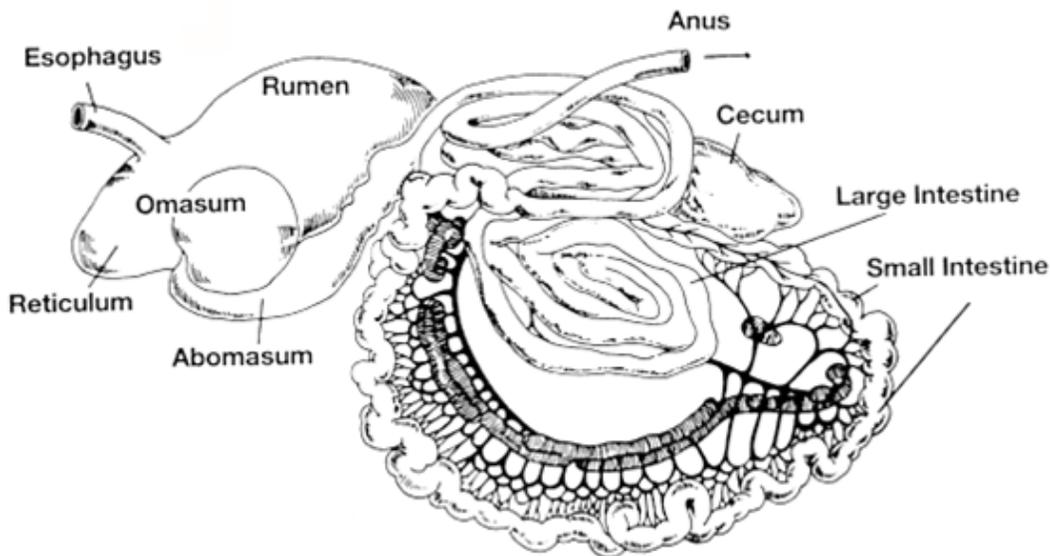

Specific nutrient requirements vary between species but also between individuals. Factors such as weight, environmental temperature, and level of production must be considered when determining optimum nutrient levels in a ration. Though it is tempting to provide more than enough as insurance, some nutrients cause problems (toxicity) if fed in excess. Also, the feeding of livestock accounts for 45-75% of production costs so overfeeding shrinks profits. Too much of a good thing is not good.

Juniors, Intermediates and Seniors

Digestive Anatomy

You are what you eat sounds silly but is somewhat true. Farm animals are grouped by what they eat, which is based on the type of digestive system they possess. *Herbivores* are vegetarians (cattle, sheep, goats, rabbits). *Carnivores* are flesh eaters (dogs). *Omnivores* eat both flesh and plants (pigs, chickens, humans). Based on the digestive system, animals are grouped as *monogastric* or *simple stomach* (pig), *polygastric* or *ruminant* (cattle, sheep, goats), *avian* (chickens), or *pseudo-ruminants* with a functional cecum (rabbits). Understanding the digestive system is fundamental to selecting the proper feeds and feeding system for your animal.

After studying this manual, you should be able to identify the parts of the digestive tract of a goat and tell the function of each part.

Feed Classification and Identification

The “stuff” fed to animals in order to meet their nutritional needs are called feeds. The National Research Council (NRC) produces many publications on nutrient requirements of animals and nutrient content of most feedstuffs. Most youth purchase “complete rations”, however, it is helpful to know what may go into those rations. Go to the web site: <http://www.ca.uky.edu/agripedia/AGMANIA/FEEDID/INDEX.asp> and study feed ingredients so that you can visually identify those typically used in livestock feeds.

Though we generally group feeds into roughages (high fiber, >18% crude fiber (CF), less digestible) and concentrates (low fiber, <18% CF, more readily digestible). There are 8 international feed classes that are based on content and use.

1. Dry forages and roughages - cut and cured products with >18%CF like hay, straw, corn cobs, shells and hulls, paper, wood by-products and stover.
2. Pasture, range plants and forages fed fresh - all forages not cut or cut and fed fresh.
3. Silages and haylages - ensiled forages like corn, alfalfa and grass.
4. Energy feeds - products with <20% crude protein (CP) and <18%CF like cereal grains (corn, oats, wheat), mill byproducts, beet and citrus pulp, molasses, animal, marine and vegetable fats, nuts, roots and tubers.
5. Protein supplements - products with >20% CP or more protein from animal origin as well as oil meals like gluten, legume seeds, milling by-products of grains, brewery and distillery by-products, yeast, non-protein nitrogen.
6. Mineral supplements
7. Vitamin supplements
8. Non-nutritive additives - supplements such as antimicrobials, antifungals, antibiotics, antioxidants, probiotics, buffers, coloring material, flavors, hormones and medicines.

Digestive Function

Intermediates and Seniors

The physical and chemical changes of feed within the gastrointestinal tract that allow nutrients to be released and absorbed into the body are called digestion. There are significant differences in the digestive processes between species. The type of digestive system an animal has determines what the animal can successfully use as feed. Complicated feed (forage) requires a complicated digestive tract (ruminant). The steps in digestion include: prehension (gathering), mastication (chewing), salivation, deglutition (swallowing), microbial, enzymatic and chemical breakdown, absorption of nutrients, defecation, and micturition (urination). For a review of rumen anatomy visit: <http://mc050.k12.sd.us/Ruminant%20Digestive%20System.ppt>

- Mouth - Upper dental pad, lower incisors and both upper and lower molar teeth used in prehension, mastication, and salivation.
- Esophagus - Hollow muscular tube that transports food from the mouth to the stomach
- Stomach - four compartments; Rumen, Reticulum, Omasum and Abomasum (8-16 gallons)
- Rumen - Large, hollow, muscular compartment that almost entirely fills the left side of the abdomen, functions in storage, soaking, mixing and microbial fermentation and acts to absorb some specific nutrients (volatile fatty acids, ammonia). (5-10 gal.)
- Reticulum- Nicknamed honeycomb, functions in moving ingested feed into the rumen or into the omasum and regurgitation of partially chewed food during rumination. Has very thick walls, traps foreign objects. (1/2 gallon)

- Omasum - Nicknamed “many plies” or butcher’s Bible, reduces particle size and removes water. It is located on the right side and holds (1/4 gallon)

- Abomasum- This is the glandular portion of the stomach which produces acid. It is located on the right, is called the true stomach and is where enzymatic digestion begins. (0.5-1 gallon)

Sm. Intestine- Pancreatic and intestinal juices break down proteins and carbohydrates while bile from the liver breaks down fats. The first section (duodenum) is involved in digestion, and the next two sections (jejunum & ileum) are actively involved in nutrient absorption. (2-2 ½ gallons and 80 feet)

Lg. Intestine- Mainly absorbs water and end products of microbial digestion. The cecum has little function in ruminants. The colon is the site for water resorption and storage reservoir of undigested material which passes out of the rectum as feces. (1.5gallon)

Feed Tag Analysis

Intermediates and Seniors

It is required by law that all commercial feed products carry a proper label. You should be able to read and understand the information on a feed tag. Some of the information included will be: net weight in pounds, company brand name (trade name), product name (class or use), product type (textured, pelleted, extruded, etc.) purpose statement, warning or cautions, active drug ingredient (when applicable), guaranteed analysis (protein, fat, fiber, etc.), feed ingredients in order of content, company name and address, detailed use directions, other feeds (suggestions for other feeds in the total program). Go to a feed store and look at the tags on several types of feeds and determine which feeds are best suited to your program and which are the best value in terms of nutrients per dollar. Be prepared to interpret the information on a feed tag.

Guaranteed Analysis:

Crude Protein: not less than __%. This number represents nitrogen content of feed and does not give a clear picture of protein quality, (e.g. amino acid profile). If all of the protein is not from “natural” ingredients (e.g. contains urea or a similar product) the following statement must be added, “This includes not more than __% equivalent protein from non-protein nitrogen”

Crude Fat: not less than __%, typically 1 to 3%. At equal volumes fat contributes 2.25 times the amount of energy compared to carbohydrates. Increased crude fat levels can decrease digestion of forages (e.g., hays and grasses). Fat can be added to the diet in hot weather to maintain energy level when intake decreases

Crude Fiber: not more than __%. The higher the Crude Fiber, generally, the lower the digestible energy of the feed. The price should reflect this lesser energy, but frequently does not.

Some manufactures also show minimum/maximum quantities of calcium and phosphorus and other macro and micro minerals. Units of vitamins A and D may also be shown.

Ingredients: listing on the tag does not necessarily identify individual feedstuffs. Instead, it uses *categories* of feedstuffs, e.g., *grain products* (such as corn, oats, barley, wheat), *processed grain by-products* (bran, brewers grain, hominy), *plant protein products* (soybean meal, cottonseed meal, etc.), *molasses products* (cane or beet molasses, dehydrated molasses, wood molasses), and *forage products* (alfalfa meal or leaf meal). The phrase, *roughage products*, identifies the presence of cottonseed hulls or other types of hulls or ground hays. This total must be shown as a percentage of the feed. Their presence will cause the crude fiber guarantee to be abnormally high (16-26% or more) and, as indicated above, lowers the digestible energy content.

The feed tag will also list sources of minerals, any preservatives used, and any vitamin supplements present or used.

The fictitious tag below is included to encourage you to think about what information is actually available on the feed tag and to consider what it means to you in your feeding program.

Goat Milker Feed

GUARANTEED ANALYSIS

Crude Protein, Minimum	16.0%
(This includes not more than 1.0% equivalent crude protein from non-protein nitrogen)	
Crude Fat, Minimum	2.0%
Crude Fiber, Maximum	7.0%
Calcium (Ca), Minimum	1.3%
Calcium (Ca), Maximum	2.3%
Phosphorus (P), Minimum	0.9%
Iodine (I), Minimum	0.00015%
Salt (NaCl), Minimum	0.25%
Salt (NaCl), Maximum075%

INGREDIENTS

Ground Newspapers, Ground Uncooked Turkey Feathers, Ammonium Nitrate, Super Phosphate, Tincture of Iodine, Used Crankcase Oil, Hardwood Sawdust, Ground Marble Chips, Vitamin A & D Oil, Ground Shoes (without Rubber Soles), Barber Shop Sweepings, Salt.

Manufactured By: LEAST IN THE EAST

Selling Directions: For price conscious feeders who are not interested in results.

Teeth

Intermediates and Seniors

No matter how good your feeding program, if an animal cannot grasp and chew the feed effectively, production will be compromised. Though managers do not routinely mouth their goats, it is a good idea to know if your animals have “sound” mouths, particularly if they are poor performers. A bonus when checking the teeth is that eruption and wearing patterns of teeth can be used to “age” an animal, particularly those from one to four years old. This useful skill is almost a lost art. Visit the following web sites and learn the steps in aging by teeth. View pictures of teeth from goats of different ages then practice on your own animals.

<http://www.smallstock.info/tools/sheep/aging.htm>

Evaluating and Selecting Feeds

Goats in the United States include dairy (intensive), Angora (mostly extensive) and Spanish or “meat” goats (mostly extensive). Goats are unique among farm animals in that they are very discriminating in what they eat. Production of milk, meat or fiber will offer differing challenges to the farmer. Type of animal, age, stage of production and season must be considered.

Dairy goats in heavy production must consume a lot of feed. One of the biggest challenges for dairy goat producers when evaluating and selecting feeds is the changing nutrient requirements in the doe’s production cycle. Shortly after kidding, the doe will be in negative energy balance because dry matter intake will fall below milk production. Later, after peak lactation, the doe will be able to restore lost body fat when the balance is shifted.

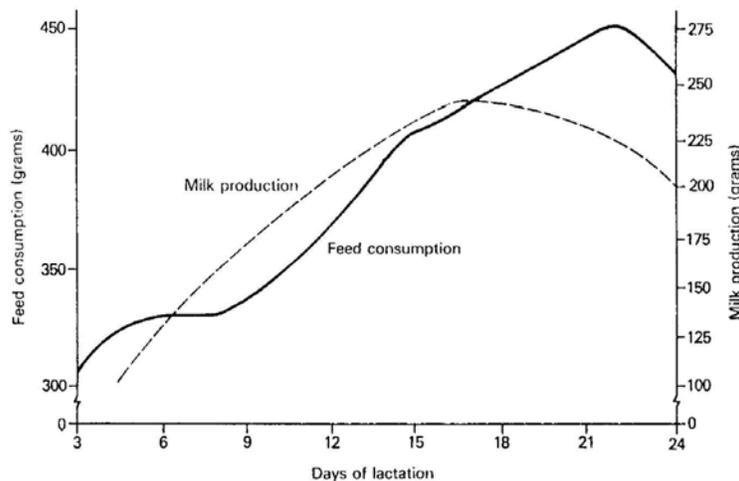

FIGURE 23-6 Doe milk production and feed consumption during lactation. [From Varela-Alvarez (17).]

The type of animal being fed is a critical consideration in selecting a feed. There are other considerations as we try to determine VALUE of a feed. It is easy to look at the price of feed per bag and assume that lower cost is the same as higher value. Spend time thinking about your feeding management situation and the types of feeds you have available. Be prepared to judge the relative value of feeds for various scenarios.

There are several methods to assess the value of a feed.

1. Physical evaluation of feedstuff: Does it look good and smell good? Is it free of dust and mold? Is it fresh? Can you see indicators of quality such as high stem to leaf ratio in hays or a high percentage of corn in a finishing ration?
2. Cost per unit of nutrients: This requires some analysis and calculations but it is not difficult.

Example:

Product	Soy Bean Meal	Linseed Meal
Crude Protein	44%	35%
Cost	\$9.40 per 100 Pounds	\$5.50 per 100 pounds

To solve this problem you must determine the value of each feedstuff for protein:

- Do this by dividing the cost by the percentage of protein

Soy bean Meal: $\$9.40/44 = 21$ cents per pound of Crude Protein

Linseed Meal: $\$5.50/35 = 15$ cents per pound of Crude Protein

Therefore linseed meal is cheaper.

Another way is to look at productivity. If you must feed your animal twice as many pounds of a low cost, but low protein feed to achieve the desired gain, it may be more cost effective to pay for a higher price but feed less total pounds.

Example:

Let's look at the feed stuffs from above but add in rate of gain expected for each feed.

Product	Soy Bean Meal	Linseed Meal
Crude Protein	44%	35%
Cost	\$9.40 per 100 Pounds	\$5.50 per 100 pounds
Rate of Gain	1.35 pounds of feed per 0.25 pound of gain	2.75 pounds of feed per 0.25 pound of gain

Solve for cost per pound of gain.

- First, determine cost per pound of feed

Soy Bean Meal $\$9.40/100$ pounds = $\$0.094$ /pound

Linseed Meal $\$5.50/100$ pounds = $\$0.055$ /pound

- Next, determine cost per pound of gain

Soy Bean Meal: $\$0.094$ /pound X 1.35 pounds feed/.25 pound gain = $\$.507$ /pound gain

Linseed Meal: $\$0.055$ /pound X 2.75 pounds feed/.25 pound gain = $\$.605$ /pound gain

On a cost of gain basis, Soy Bean Meal is Cheaper

3. There are a number of chemical analyses that are carried out on feeds by the companies that produce them. This information is useful in evaluating quality.
4. An often used method of determining quality is to do a home feeding trial. You may do this already without thinking about it. If you run into problems one year, you make adjustments the next year. With limited numbers of animals, this is a slow, often costly process.

Evaluating Feed Efficiency

Seniors

Performance in goats can be evaluated by calculating average daily gain as well as feed efficiency. Feeding management strategies should strive to optimize growth to reach the desired end point in an appropriate time frame. For example; if the beginning of the breeding season is 180 days away and your young doe must gain 45 pounds in order to reach puberty, the doe must gain an average of .25 pounds per day. If the doe eats 1.5 pounds of feed per day for 180 days at that rate of gain, feed efficiency for that period of time is 6 pounds of feed per pound of gain. The cost of gain is determined by multiplying the cost per pound of feed by the pounds of feed per pound of gain. Therefore, in this scenario, $\$8.00$ per 100 pounds of feed with 6:1 feed efficiency comes out to $\$0.48$ per pound of gain.

Processing Feeds**

Because feed constitutes a major portion of the cost of intensive animal production, it is very important that a diet have the right nutrient content and be in a form that will encourage consumption without excessive feed waste. Feeds are often processed by mechanical, chemical or thermal methods in order to alter the physical form or particle size to prevent spoilage, isolate certain parts of the seed or plant, to improve palatability and digestibility, or sometimes to inactivate toxins. Occasionally feed is processed to improve handling, like chopped hay. Some methods include: roller mill cracking, grinding, steam-rolled and steam-flaked, pelleting, extruding, popping, drying and cubing. Obviously there are costs associated with processing so the improvements in productivity must offset price increases.

Poisonous Plants**

Goats have a stronger resistance to certain toxins than cattle, but there are plants that can poison goats. These include Death camas, Grease wood, Horse brush, Rubber weed, Sneezeweed, Broom weed, Choke cherry, Copper weed, Desert parsley, Halogeton, Loco, Leu pine, Milk weed, and Veratrum. Visit the following web sites to learn about the poisonous plants in the southeast.

<http://www.ansci.cornell.edu/plants/anispecies.html>

<http://www.caf.wvu.edu/~forage/library/poisonous/page10.htm>

Common Nutritional Disorders**

Disorder

Hardware disease

Ketosis

Milk fever

Acidosis

Nutritional muscular dystrophy

Grass tetany

Night blindness

Goiter

Rickets

Anemia

Enterotoxemia

(overeating disease)

Founder (laminitis)

Photosensitization

Bloat

Urinary calculi

Chief Cause

Wire or nails lodged in reticulum

Sudden need for extra energy

Sudden need for Ca (lactation)

Excess grain consumption

Se or vitamin E deficiency

Mg deficiency

Vitamin A deficiency

Iodine deficiency

Ca, P, or vitamin D deficiency (young animals)

Fe, Cu, vitamin B12, or folic acid deficiency

Rapid growth of *Clostridium perfringens* after overeating

Too rapid change in the ration.

Some feeds or forages or accumulation of metabolites

Legume, succulent forages causing slime producing bacteria to increase and slime causes trapping of gas.

“water belly” in males; stones block urination. Caused by excess phosphorus and magnesium or imbalance of Ca and P.

DAIRY GOAT SHOWMANSHIP

ATTIRE:

Required Dress Code: All exhibitors will be required to be clean and neat and dressed in white, green, dark blue or dark black jeans or slacks with a solid white shirt with a white collar. FFA and 4-H accessories are strongly recommended. No caps or hats. Closed-toed shoes or boots are required. Exhibitors not conforming with the Dress Code will not be allowed to enter the Show Ring.

Appearance of Animal 40 points

- Condition and Thriftiness - showing normal growth- neither too fat, nor too thin.....10
- Hair - clean and properly groomed and Hoofs - trimmed and shaped.....10
- Clipping - entire body, neatly trimmed tail and ears10
- Cleanliness - body free from stains, with special attention to legs, feet, tail area, nose and ears10

Appearance of Exhibitor 10 points

Clothes and person neat and clean.

Showing Animal in the Ring..... 50 points

Leading - Enter, leading the animal at a normal walk around the ring in a clockwise direction, walking on the left side, holding the collar with the right hand. Exhibitor should walk as normally and inconspicuously as possible.....10

- ▶ Goat should lead readily and respond quickly.
- ▶ Lead equipment should consist of a collar or small link chain, properly fitted.
- ▶ As the judge studies the animal, the preferred method of leading is to walk alongside on the side away from the judge.
- ▶ Lead slowly with the animal's head held high enough for impressive style, attractive carriage and graceful walk.

Pose and show - The animal should be between the exhibitor and the judge as much as possible.....15

- ▶ Avoid exaggerated positions, such as crossing behind the goat.
- ▶ Pose animal with front feet sparsely beneath and hind feet slightly spread. Where possible, face animal upstage with her front feet on a slight incline. Neither crowd other exhibitors, nor leave too much space when leading into a side-by-side position.
- ▶ When judge changes places, lead animal forward out of line, down or up to the place directed and then back through the line, finally making a U-turn to get into position.
- ▶ To step animal ahead, use slight pull on collar. If the animal steps badly out of place, return her to position by leading her forward and making a circle back through your position in the line.
- ▶ When judge is observing the animal, if she moves out of position, replace her as quickly and inconspicuously as possible.
- ▶ Be natural. Over showing, undue fussing and maneuvering are objectionable.

Show animal to best advantage - recognize the conformation faults of the animal you are leading and strive to overcome them15

Poise, alertness and courteous attitude - exhibitors should keep an eye on their animals and be aware of the position of the judge at all times, but should not stare at the judge. Exhibitors should not be distracted by other activities going on. Respond rapidly to the requests from judges or officials, and be courteous and sportsmanlike at all times. The best exhibitors will show the animal at all times - not themselves - and will continue exhibiting well until the entire class has exited10
